

FocusBuddy

Project summary - saved 2026-07-11 (pre-migration cleanup)

What it is: Study/productivity app — React + TypeScript, Vite, Gemini API (chat + live voice), Firebase, consolidated Toolbox.

Status: In revisions / debugging

Live: <https://focusbuddy-v3.netlify.app>

GitHub: FocusBuddy (public) — default branch cowork-2026-07-11 = current v3 snapshot

Local folder: ~/CoWork/VibeCoding/FocusBuddy

Key details

- Branch question RESOLVED 2026-07-11: Netlify = source of truth, v3 = current (per Erin); local snapshot pushed as default branch
- Old branches (main, v3-rebuild) deleted 2026-07-11 — recovery SHAs in the memory file; repo = ONE branch
- Local .env holds secrets; old exposed Gemini key still needs rotating at Google
- Known: Gemini Live voice turn-taking latency is a model limitation, not a bug

Where we left off

Fully backed up, single branch = current v3, hardened .gitignore included. Remaining: rotate the old exposed Gemini key at Google (only Erin can — needs her Google login), then continue debugging.
